

Azure DevOps

Deliver business value quickly with collaborative development and managed deployments

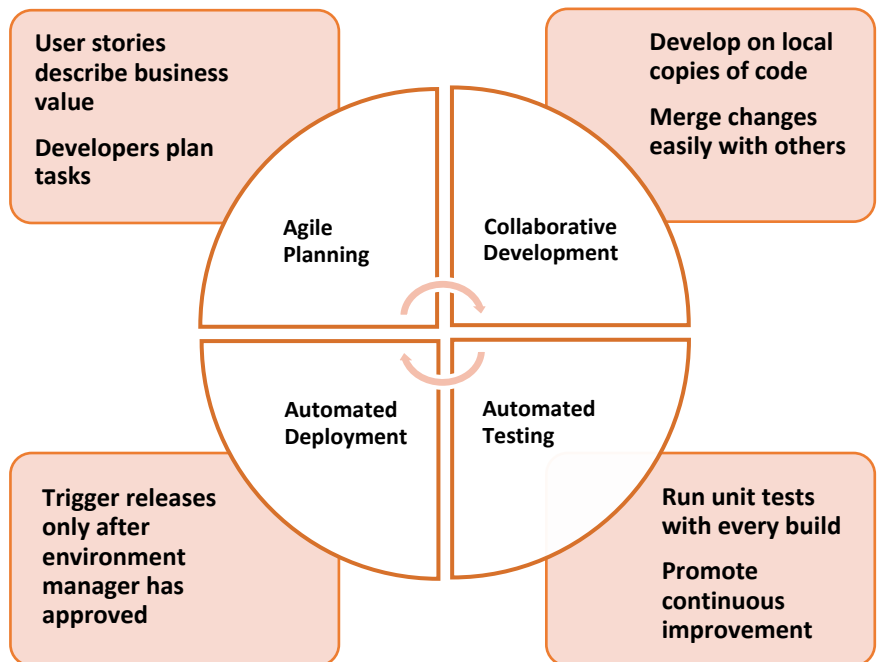

What is Azure DevOps?

DevOps is a modern suite of integrated development services

Plan Agile projects, keep a history of all your changes, test your solutions automatically and automate your release and approval processes

DevOps allows your development teams to focus solely on delivering business value

Save **2-3 days** per sprint in recovered productivity

What can you achieve?

- Drive collaboration within your team with a managed branching and merging strategy
- Approvals configured by environment, sent to your inbox or posted to your Teams channel
- Deploy solutions automatically across multiple environments
- Test with every build
- Create and drop new environments automatically
- Shorten release cycles with confidence that your new code will not break existing functionality

What benefits can you expect?

- Control risk by using appropriate approval gates depending on the scale of each project
- Developers focus solely on solving problems, reducing typical delivery estimates by days
- Enable centralised and decentralised analytics with easily deployable sandbox environments
- Improve your team's capability and accelerate maturity. Demonstrate to internal and external stakeholders that your projects meet professional standards
- Encourage more frequent, smaller releases with easy rollback to a prior version

Why is it different?

- Integrates simply with most Azure components
- Simplifies your communication by posting into your Teams channels
- Marketplace extensions can help deliver a development and release capability that is right for your organisation
- Removes the barrier between business and IT with collaboration and visibility
- Data and Analytics teams can embrace the same practices that have allowed application developers to flourish
